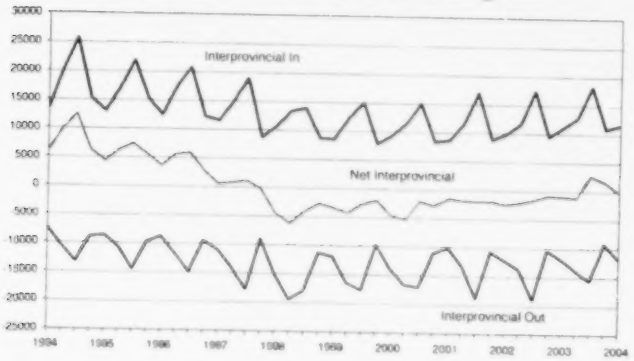
Migration Highlights ♦ First Quarter 2004

During the first quarter of 2004, B.C. gained a total of 7,417 persons as a result of net migration from **all sources**. This is substantially higher than the 4,448 in the first quarter of 2003. The increase in total net migration for the latest quarter was primarily a result of an increase in net international migration, and to a lesser degree, a reduction in net interprovincial outflows.

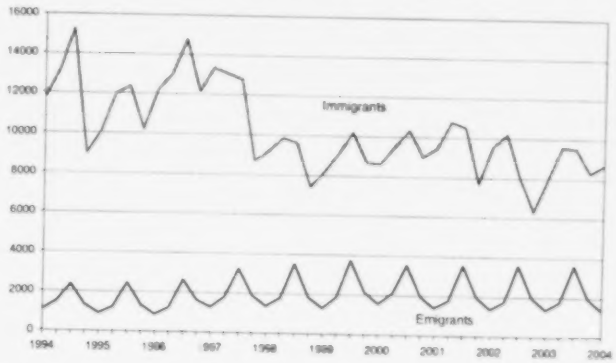
Net **interprovincial** migration dropped in the first quarter of 2004 (-250) after having been positive in the last two quarters of 2003. Usually the winter months, particularly the 1st quarter, have lower levels of in and out migration, and may partially account for this dip. Alberta received the largest number of the out migrants (930) and Ontario provided the largest number of in migrants (601).

Interprovincial In, Out, and Net Migration



Net **international** migration to the province increased, from the first quarter 2003 net inflow of 7,195 to a 2004 first quarter net inflow of 7,677 persons. This resulted primarily from an increase in immigration from 7,961 to 8,666 people. Readers should note that the data on emigration are drawn from the 1st quarter of the previous year. Over the last several decades immigration has fluctuated from highs of above 14,000 to lows of under 3,000 people per quarter. The number of immigrants to the province has been declining since the mid nineteen nineties. Emigration appears to fluctuate more moderately, however this component is the most difficult to accurately measure.

Immigration and Emigration



Immigration to Canada increased from the first quarter last year (45,560 to 54,900), while B.C.'s share of total Canadian immigration decreased from 17.5% to 15.8%. British Columbia's population grew by 1.0%, while Alberta (1.3%) and Ontario (1.1%) had the highest annual growth rates among the provinces. Yukon had the highest growth of any region relative to its base population at 2.3%.

Population Growth

Prepared by: Population Section, BC STATS

Source: Statistics Canada

Date: 23 June 2004

Note: Net N.P.R. - Net change in the number of Non-Permanent Residents.
Due to revisions on the part of Statistics Canada, the sum of the components may not equal the population change.
All figures subject to revision.

Table 5

Quarterly Components of Change Per 1000 Population for Canada

		Migration									Natural Increase			Total	Population	
		Interprovincial			International					Total Net						
Year	Quarte	In	Out	Net	Immigration	Emigration	Net N.P.R.	Net Temp. Abroad	Returning Emigrants	Net	Migration	Births	Deaths	Natural Increase	Total Increase	Population at End of Period	Annual Growth Rate (%)

Migration Highlights ♦ Second Quarter 2004

Correction

Table 2 of **Migration Highlights, Second Quarter 2004** contained errors and has been replaced by the data accompanying this note. The complete release is being replaced for your convenience, but the errors were limited to the rightmost two columns from the 3rd quarter 2001 to the end of the table. The highlights and article were not affected.

The columns described are:

1) (BC) **Population at End of Period**, and

2) **Annual Growth Rate (%)**

We sincerely apologise for any inconvenience this may have caused you.

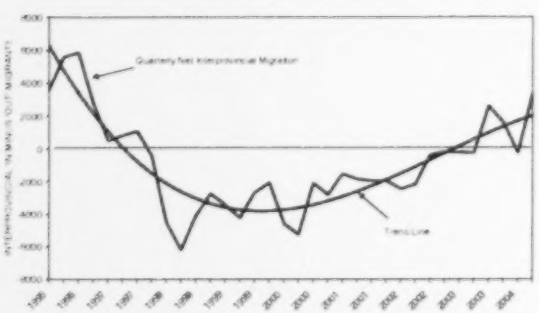
Migration Highlights ♦ Second Quarter 2004

During the second quarter of 2004, B.C. gained a total of 10,249 persons as a result of net migration from **all sources**. This is substantially higher than the 7,143 and the 4,448 in the first quarter of 2003 and 2002 respectively. The increase in total net migration for the latest quarter was primarily a result of an increase in net interprovincial migration, while net international migration declined.

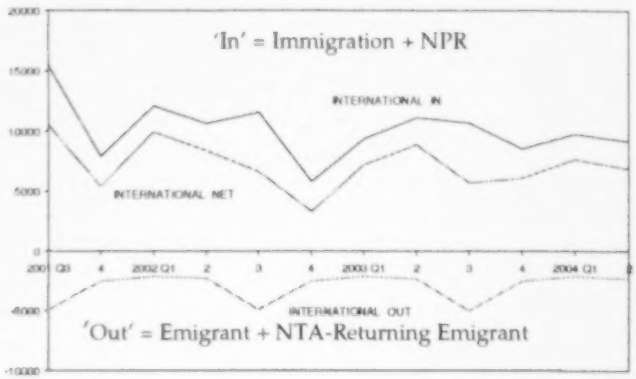
Net **interprovincial** migration rose in the second quarter of 2004 (3,369) after having been slightly negative (-250) in the first quarter of this year. This latest increase is a return to the positive numbers seen in the last quarters of 2003 and was the largest net in flow of population since 1996. The largest contributor to the recent increase was Ontario (1,556) followed by Alberta (1,233).

Net Interprovincial Migration—2nd Quarter



Net **international** migration to the province decreased, from the second quarter 2003 net inflow of 8,877 to a 2004 second quarter net inflow of 6,880 persons. The decline was due primarily to a decrease in net non-permanent residents. Estimates of *emigration, temporarily abroad,* and *returning emigrants* have remained virtually unchanged since 2001. On an annual basis immigration alone rose to 36,620 in the year from July 2003 to June 2004, up from 31,937 in the previous twelve month time period.

International 'In', 'Out', and 'Net' Migration



Net international migration to Canada declined marginally from the second quarter last year (63,635 to 62,596), while B.C.'s share decreased from 14% to 11%.

British Columbia's total population grew by 13,665 people, behind Ontario (45,254) and Quebec (15,350) and ahead of Alberta (11,459). International migration accounted for the largest portion of BC's growth followed by interprovincial migration and natural increase respectively.

Population Growth Second Quarter 2004	(000s)
Population: April 1, 2004	4,182,928

Minus Total Net Emigrants	2,272
Plus Net Non-Permanent Residents	-910
Plus Births	10,278
Minus Deaths	7,072
Population July 1, 2004	**4,196,383**

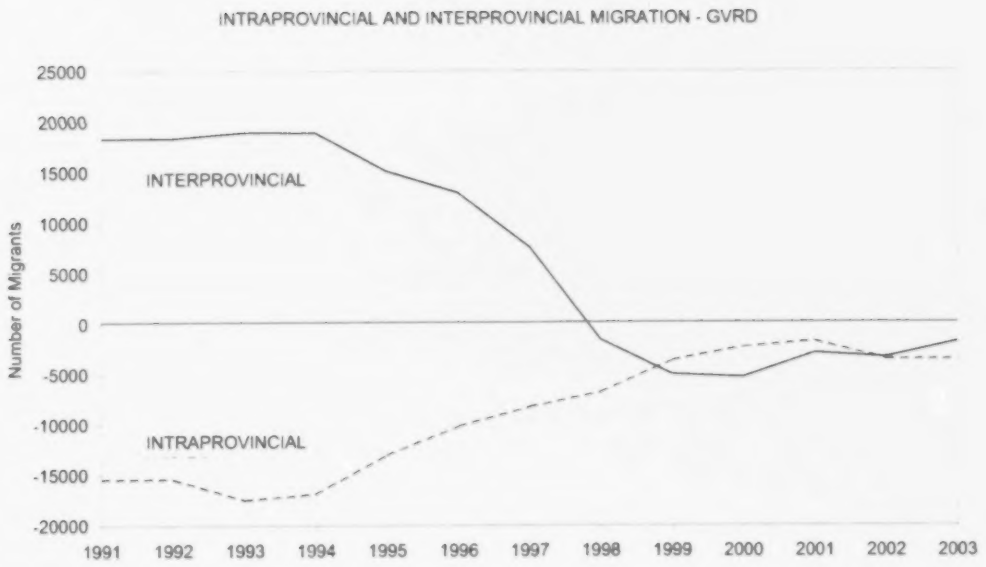
Feature Article – Intrapovincial Migration

Summary
Migration is considered to be an important contributor to population change for British Columbia. International migration often receives the greatest attention as it is often viewed as providing much needed foreign capital and skills. Interprovincial migration also receives considerable attention as it is considered to be an indicator of prosperity relative to the rest of the country. However, the importance of intraprovincial migration, or the movement of people within the province, provides a fundamental understanding of regional economic cycles and the interactivity between various sources of migration.

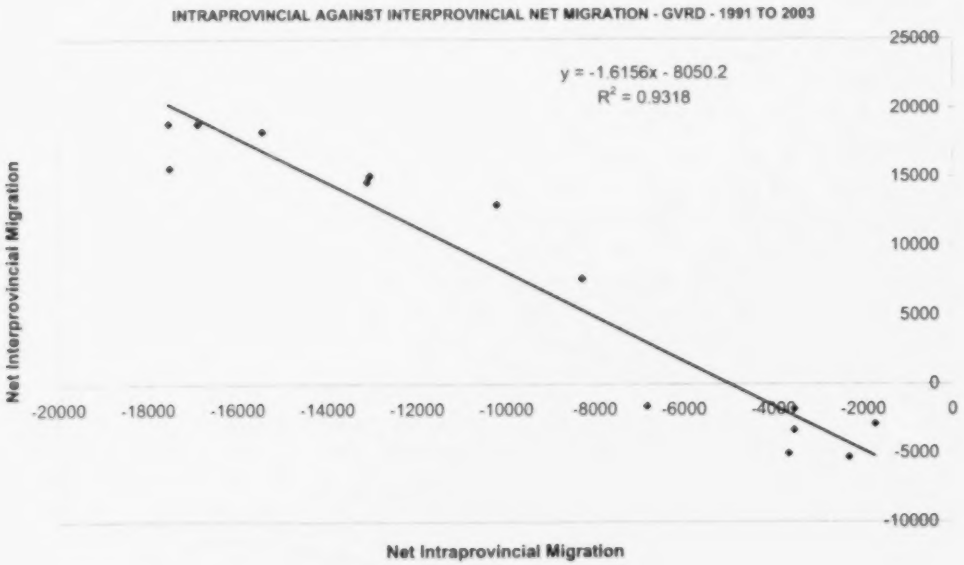
Overview
Intraprovincial migration refers to migration between areas within the province. Data for intraprovincial migration is available for Regional Districts (RDs) for the years from 1986 to 2003. Variations in migration within the province highlight the differences between highly populated RDs and those RDs with relatively low numbers of people. The highly populated areas are often referred to as core areas and are exemplified by high density, while areas with low numbers of residents are referred to as peripheral areas, exemplified by low density.

Economic activity differs between the two extremes on the spectrum of population density. In the core areas, the economy is considered to be more diversified while in peripheral areas the economy is often dependant on one or two main activities. In BC, peripheral areas are highly dependant on resource extraction, particularly logging, and primary processing. Economic activity in these areas is vulnerable to fluctuations in demand for raw resources. These swings in demand for commodities are often referred to as boom and bust cycles. It follows that as economic activity increases in peripheral areas, 'in' migration also increases with the majority of the new residents coming from core areas, while as economic activity decreases in peripheral areas, 'out' migration increases with the majority of migrants moving to more densely populated areas. This expansion (or movement out of core areas to peripheral areas) is followed by a contraction (or movement from rural areas back to highly populated areas), which is then followed by another expansion.

Increased demand for resources not only results in higher prices, more job opportunities, and migration out of core areas, it also strengthens the provincial economy. This in turn makes BC attractive to people outside the province. The relative economic activity between BC and the rest of Canada (particularly Ontario and Alberta) is a good indicator of interprovincial migration. During economically robust times, migration out of core areas to the rest of the province increases, and interprovincial migration from the rest of the country to the province and to core areas also increases.



Again, the relative strength of the provincial economy as measured by GDP in relation to the rest of the country varies over time. Net *intraprovincial* (in minus out) migration for the Greater Vancouver Regional District (GVRD) is highly negatively correlated with net *interprovincial* migration for the GVRD.



Although intraprovincial migration for the GVRD fluctuates it tends to be negative, contributing far more people to other RDs than it receives. Over the last fifteen years, 150,000 more people moved out of the GVRD than moved in to it from other parts of the province.

Intraprovincial migration to BC's second largest core area, the Capital RD is similar to that of the GVRD, albeit at a much smaller scale. Nonetheless, it also tends to contribute more migrants during 'boom' times, and receives more during 'down' times. Intraprovincial migration for these two core areas are highly positively correlated (+87%) but they are both highly negatively correlated with most of the rest of the province. If intraprovincial migration is used as a measure of economic hardship, the last 'down' time in the late nineties and early 2000 was not as bad as that of the early to mid eighties.

The regional districts that do not follow this tendency are the intermediate sized Fraser Valley (FVRD), Central Okanagan, and Nanaimo RDs. These RDs (with the exception of the FVRD in 1986) remained positive throughout time period – through both boom and bust times.

If this propensity for migrants to move between higher and lower density areas depending on levels of economic activity remains true for these intermediate areas, then people may be moving in from rural areas during 'down' times while people may be moving in from core areas during 'boom' times.

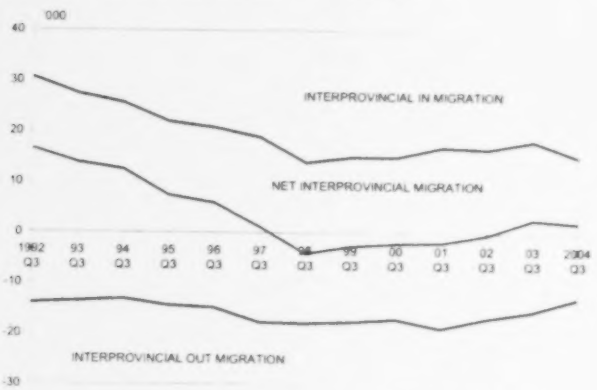
Migration Highlights ♦ Third Quarter 2004

During the third quarter of 2004, B.C. gained a total of 10,229 persons as a result of net migration from **all sources**. This is virtually unchanged from the second quarter of 2004, but higher than the 8,330 and the 6,266 in the third quarter of 2003 and 2002 respectively. Although net interprovincial migration was lower than in the previous quarter, the number of non-permanent residents increased.

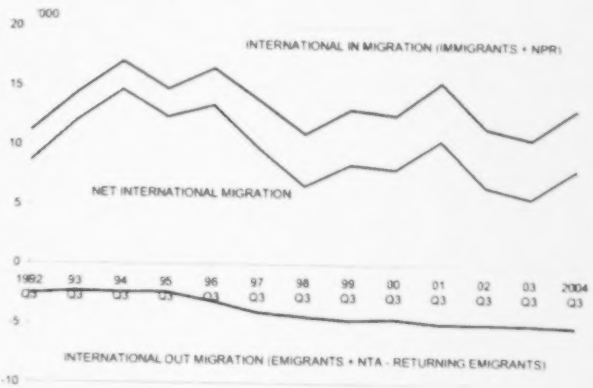
Net **interprovincial** migration dipped in the third quarter of 2004 (2,058) after having reached 3,369 in the second quarter of this year, the highest figure since the third quarter of 1996. The largest contributor during the 3rd was Ontario (1,168) followed by Manitoba (268).

Interprovincial Migration – 3rd Quarter



Net **international** migration to the province increased, from the third quarter 2003 net inflow of 5,716 to a 2004 third quarter net inflow of 8,171 persons. The rise was due primarily to an increase in net non-permanent residents (refugee claimants and holders of work, student, and ministerial permits). On an annual basis, immigration rose to 37,652 in the year from September 2003 to 2004, up from 33,408 in the previous twelve month time period. Almost 4,000 people left BC for other countries in the latest quarter.

International Migration – 3rd Quarter



Net international migration to Canada rose marginally from the third quarter last year (53,616 to 60,805), while B.C.'s share increased from 10.7% to 13.4%.

British Columbia's total population grew by 13,473 people, behind Ontario with 47,034 and Quebec with 17,832, but ahead of Alberta with 10,918. International migration accounted for the largest portion of BC's growth followed by interprovincial migration and natural increase respectively.

Population Change
Third Quarter 2004

Population: July 1, 2004	4,196,383
Plus Interprovincial Arrivals	15,025
Minus Interprovincial Departures	12,967
Plus Immigrants	10,465
Minus Total Net Emigrants	5,126
Plus Net Non-Permanent Residents	2,832
Plus Births	10,349
Minus Deaths	7,105
Population October 1, 2004	**4,209,856**

Feature Article – Regional Migration

Migration, both between provinces and within the province, is a major factor driving population change within British Columbia. In addition to affecting the total population, the age of the migrants also influences the types of goods and services required to meet the needs of people.

Interprovincial Migration

Unlike international migration, which is largely concentrated in the lower mainland, *interprovincial* migration (between other provinces) and *intraprovincial* migration (between regions within BC) have a more wide spread impact across the province. Revised information on regional migration is now available for the period July 1, 2002 to June 30, 2003. During this period, the province experienced negative net migration, an out-flow of 1,037 people to other provinces. This resulted from a relatively small in-flow of 48,078 people from other parts of the country, accompanied by marginally higher out-flows of 49,115 people. Net interprovincial migration was less negative than in 2001/2002 when approximately 8,500 more people moved out of the province than moved in.

The following table shows the regional districts ordered from highest total net interprovincial migration for all ages to the lowest. Across the province, 11 regions had positive net migration, in-flows, from other provinces. Perhaps not surprisingly, the Capital Region had the highest in-flow with 6,473 people moving in, while 5,045 people moved out for a population increase of 1,374 people. The other large core area in the province, the Greater Vancouver Regional District, on the other hand, had the largest negative net interprovincial migration with 18,119 people moving in but 19,585 people moving out to other provinces resulting in a net out-flow of 1,466 people. Other high negative out-flows occurred in the interior of the province; from Fraser-Fort George and Thompson-Nicola.

Intraprovincial Migration

Intraprovincial migration refers to the number of people moving from one area in the province to another within the province. Over the 2002 to 2003 time period, only 90,155 people migrated between Regional Districts, a relatively low figure. There tends to be a relationship between interprovincial migration and intraprovincial migration. Periods when there are more people moving into BC from other parts of the country also have more people moving within the province. For example, in 1989/1990, 82,200 people migrated to BC from other provinces and another 140,800 people relocated to other regions within the province. Mobility tends to increase with an increase in economic activity.

In the 2002/2003 time period, the Central Okanagan had the highest net in-flow of people from within the province, followed by the Nanaimo Regional District with estimates of 2,243 and 1,424 respectively. Again, as was the case for interprovincial migration, Greater Vancouver and Fraser-Fort George had the highest net intraprovincial out-flows with estimates of -3,646 and -1,166 respectively.

The following table shows the regional districts ordered from highest total net intraprovincial migration for all ages to the lowest. Greater Vancouver has experienced a reduction in net out-flows to both other provinces and other regions during the last several years from highs of over -8,700 people per year in 1998/1999 to -5,112 in 2002/2003. This is due in large part to a decline in out-migration to other parts of the country from highs of over 23,600 people in 1998/1999 to approximately 19,580 people in 2002/2003. However, losses of population from the GVRD to other parts of BC and Canada were more than off-set by gains from international migration.

International Migration

Approximately 90% of the people coming to the province from other countries move to the Greater Vancouver Regional District. In 2002/2003, over 28,000 international migrants moved to the GVRD.

Other regions of the province receive much lower international migration. In 2002/2003, the Fraser Valley had the second highest number of immigrants at approximately 1,100 people while the Capital Region received 686 people from outside of Canada.

Age of Migrants

Migrants are most often people in their late teens to mid-twenties, usually moving away from their childhood home, seeking education and or employment. Thereafter, often those between 25 and 44 move again to start families of their own, for work and to improve their housing. Between 45 and 64, people may move as children leave home and in some cases, as proximity to work is no longer required. After 65, people may move due to retirement, sometimes moving away from high density areas to places outside of congested commuter flows or they may move to be closer to amenities. In the 2002/2003 time period, approximately 38% of population loss as a result of net **interprovincial** migration was between the ages of 25 and 44. Persons in this age group tend to move for economic reasons, often aimed at meeting commitments to the nuclear family. Although, the 18 to 24 year old age group only includes six years, or less than a third of the 25 to 44 age group, they accounted for close to 20% of the population loss in 2002/2003. Persons in this age group tend to have fewer commitments, both in terms of family and assets, than those in the older age groups, resulting in relatively lower social and economic costs from migration.

Intraprovincial migration is more evenly distributed by age. In many cases the social and economic costs of moving to another part of the province are much lower than for moving between BC and another province, especially if the move is to a neighbouring region.

Although the proportion of **interprovincial** migration attributable to seniors is relatively small, it is increasing as more people reach retirement. As well, their migration is less likely to be affected by the relative economic conditions in different provinces. Nonetheless, interprovincial migration for people in this age group is far less likely than is intraprovincial migration. In 2002/2003, only 3,066 people 65 and over moved into the province while approximately 8,000 elderly moved within the province. One of the main reasons for moving long distances is to be closer to family.

While the GVRD and the Capital Region had opposite migration flow totals, they had similar flows for those over 65. Both regions had more interprovincial in-migrants than out-migrants while they also had more intraprovincial out-migrants than in-migrants.

Perhaps, one of the reasons that the Central Okanagan has such a high positive net intraprovincial migration is that it attracts people of working age as well as those who no longer need to live in close proximity to work, e.g. retirees. This region gained over 2,200 people in 2002/2003 from intraprovincial migration and also gained approximately 830 people from other provinces. However, there was a net loss of approximately 50 people to other provinces for those 18 to 24, with 439 moving in but 489 moving out.

This tendency for negative net migration, whether intra or inter provincial, for youths between 18 to 24, was not uncommon as only six regions had positive figures. The Capital Region and the GVRD had more youths move in than out, perhaps due to educational opportunities as well as other economic and social reasons. Squamish-Lillooet also had positive flows, likely due to the attractiveness of the Whistler resort for work and play. The only other regions with positive flows for youths were the Peace River and Northern Rockies regions which have been particularly attractive to males who can earn relatively high wages while living in wide open spaces.

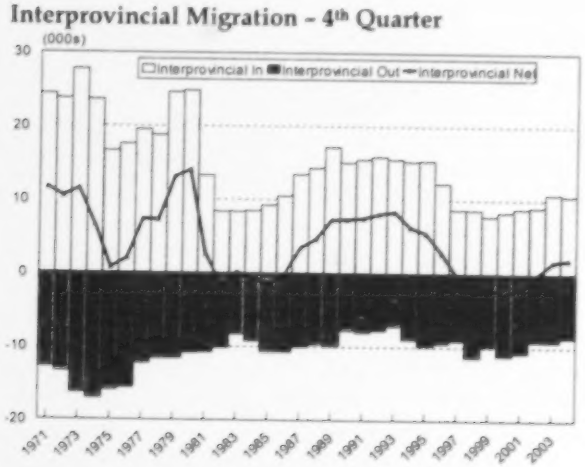
Migration Highlights ♦ Fourth Quarter 2004

During the fourth quarter of 2004, B.C. gained a total of 7,671 persons as a result of net migration from **all sources**. This is lower than the third quarter 2004 but virtually unchanged from the fourth quarter of 2003. Although the international net migration declined, the interprovincial net migration continued to increase.

Net **interprovincial** migration was estimated at 1,903, the highest fourth quarter result since 1996 (see table). The largest contributor during the 4th quarter was Ontario (1,548) followed by Manitoba (312). Between October 1, 2004 and January 1, 2005, 205 more people moved from BC to Alberta than moved from Alberta to BC.

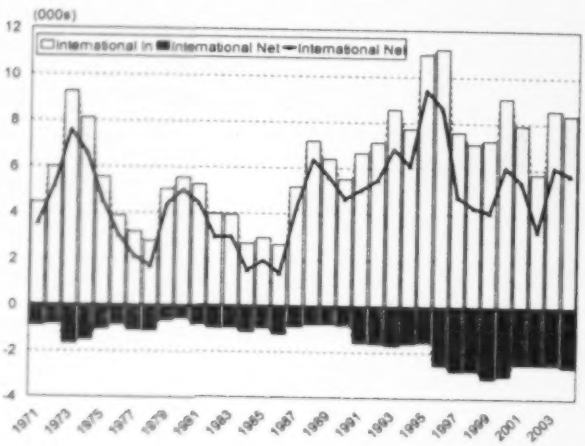
Interprovincial Migration - 4th Quarter



On an annual basis, net interprovincial migration rose from 3,747 in 2003 to 7,080 in 2004.

Net **international** migration to the province declined between the fourth quarters of 2003 and 2004, from an estimated 6,079 to 5,768 persons. This decrease resulted from a small decline in the number of net immigrants (immigrants plus net non-permanent residents) and an increase in the number of net emigrants (emigrants plus temporary abroad, minus returning emigratns). As is usually the case, fourth quarter net international migration was lower than the third quarter.

International Migration - 4th Quarter



British Columbia's total population grew by 10,112 people (1.1%), slightly behind Alberta with 10,602 and ahead of Ontario with 9,747 and Quebec with 8,048. International migration accounted for the largest portion of BC's growth followed by natural increase and interprovincial migration.

Population Change
Fourth Quarter 2004

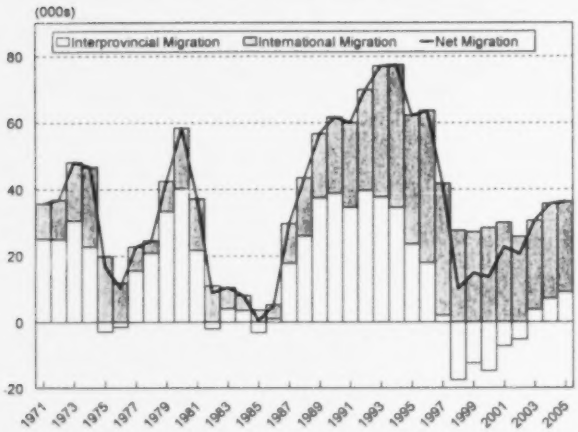
Population: October 1, 2004	4,209,856
Plus Interprovincial Arrivals	10,564
Minus Interprovincial Departures	8,661
Plus Immigrants	7,550
Minus Total Net Emigrants	2,588
Plus Net Non-Permanent Residents	806
Plus Births	9,942
Minus Deaths	7,501
Population January 1, 2005	**4,219,968**

Feature Article: B.C. Migration - Outlook for 2005

Summary

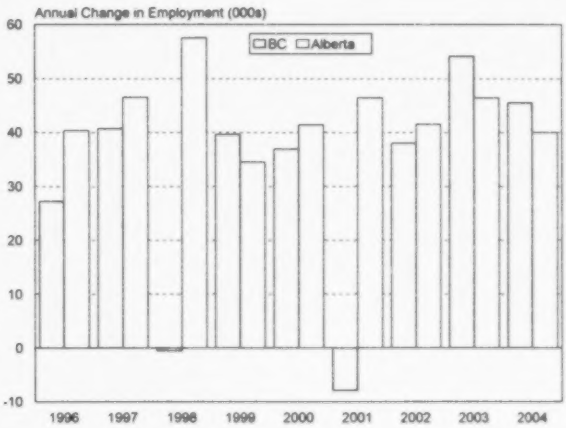
During the 2005 calendar year, the population of British Columbia is expected to increase by approximately 42,750, of which net migration from other provinces and countries is expected to contribute approximately 34,100 people. This is stronger than the net inflows of the previous five years, and is due to an improving outlook for interprovincial migration. During the course of 2005, the outflows to other provinces are expected to continue to be lower than inflows.

Net migration to B.C. is expected to increase to 34,100 people in 2005.



During the late 1980s and early 1990s, migration to British Columbia from the rest of Canada and the rest of the world exhibited large increases, reaching a peak of 77,116 persons in 1994. The large inflows of population to B.C. strengthened total consumer spending and residential investment. This increase in economic activity, in turn, created jobs and income within the province. From 1990 to 1994, B.C. had the highest rate of job creation of any province in Canada, and from 1995 to 1997 B.C.'s employment growth continued to be above the national average. However, this changed in 1998 when employment growth in B.C. dropped to 0.1% and remained below the national average until last year. During 2004, the rate of employment growth was higher than the Canadian average and amongst the highest in the country. Employment grew from an average of 2,014,200 in 2003 to an average of 2,059,700 in 2004, an increase of 45,500. This growth was higher than Alberta's but lower than Ontario's and Quebec's. Overall Canadian employment increased 284,600 or 1.8 percent, compared to BC's growth of 2.3 percent. On the other hand, the unemployment rate remained higher in BC compared to Ontario and Quebec.

The number of jobs in B.C. increased by 45,500 in 2004



Given the influence of population growth on labour markets and overall economic performance, it is important to examine what is in store for migration to British Columbia in 2005. Net migration to B.C. has been quite volatile over time. The record high net inflow during 1994 of close to 80,000 persons is in sharp contrast to the lows of 6,200 in 1985 and 6,800 in 1998, thirteen years later. This volatility is one of the reasons why it is difficult to accurately predict migration. Most researchers would agree that the first step to forecasting migration is to isolate the factors that influence migration, then attempt to predict those factors. The task of isolating these factors is simplified by separating migration into the international and interprovincial components.

International Migration

International migration to British Columbia is largely determined by federal government policy. This forecast assumes that there will be enough people interested in coming to Canada to meet the stated federal government levels. The federal government sets an overall annual immigration planning level for Canada. These planning levels are not intended to be rigid quotas and actual immigration may exceed or fall short of the planning level. In 2004, the planning level was established for 2005 of 220,000 to 245,000 persons, the same level used for the last two years.

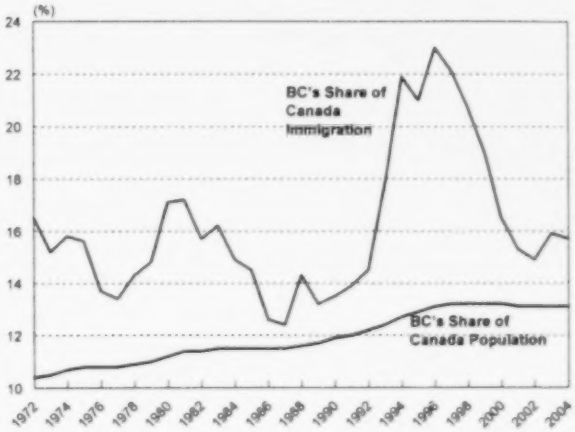
The planned immigration levels since 1990 are shown in the following table along with actual immigration to Canada and the B.C. share. The steady increase in immigration to Canada experienced since the mid-1980s levelled off to between 212,000-226,000 persons annually over the 1994-1997 period. Immigration to Canada in 1998 weakened, largely due to the conclusion of the handover of Honk Kong to China, but has since returned to mid 1990 levels.

Canadian Immigration

Year	Planning Level	Actual	B.C. Share
	(000's)	(000's)	(%)
1990	200	214	13.4
1991	220	231	13.9
1992	250	253	14.5
1993	250	256	17.9
1994	250	224	21.9
1995	190-215	212	20.9
1996	195-220	226	23.0
1997	195-220	216	22.0
1998	200-225	174	20.6
1999	200-225	190	19.0
2000	200-225	227	16.5
2001	200-225	250	15.3
2002	210-235	229	14.8
2003	220-245	221	15.9
2004	220-245	236	15.7
2005	220-245		

Starting in 1993, British Columbia experienced a significant increase in its share of immigrants coming to Canada, likely resulting from the change in governance of Hong Kong. B.C.'s immigration share peaked in 1996 at 23 per cent declining to 14.8 per cent in 2002, but has since risen to close to 16%.

B.C.'s share of immigrants to Canada was 15.7% in 2004.

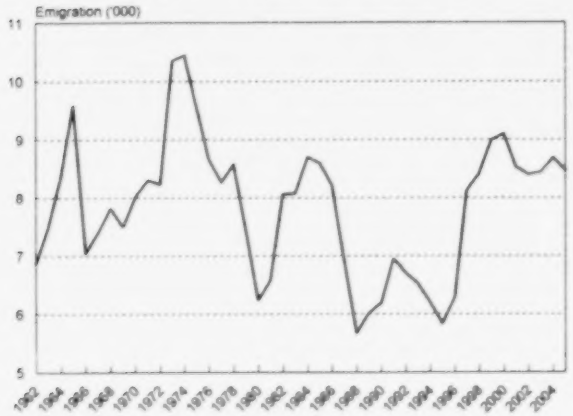


While the share of immigrants coming to BC declined marginally in 2004, the actual numbers of immigrants coming to Canada rose slightly. The number of immigrants to BC rose by close to 1,800 between 2003 and 2004, from 35,245 to 37,041 respectively. Ontario's share of immigrants has declined from 59.3% to 53.1% since 2001. Quebec, which is the only province to have responsibility for the selection of some classes of immigrants, increased its share of immigration by 3.8 percentage points since 2001 to 18.8% in 2004.

It is likely that B.C.'s share of Canadian immigration in 2005 will again be around the 15 to 16 percent mark. It is forecast that there will be approximately 230,000 immigrants to Canada in 2005. After accounting for changes in the other components of international migration, particularly emigration, net international migration to British Columbia in 2005 is expected to be 27,185 persons, down marginally from the 28,476 estimated in 2004. The number of people

emigrating from BC is difficult to measure; however, despite the increase in the number of people returning to Asia after the turn over of Hong Kong, and the burgeoning economies in Asia, it is assumed that emigration will decline marginally in 2005.

The total number of emigrants from BC is expected to decline in 2005.



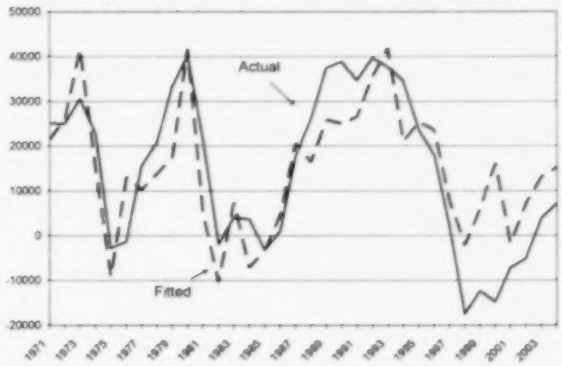
Interprovincial Migration

Unlike international migration, interprovincial migration is not regulated directly by government policy, although it is still influenced by a wide variety of factors. Unregulated migration can be viewed essentially as a combination of "push" factors that pressure a migrant to move, and "pull" factors that attract a migrant to a particular location. Consequently, movement between provinces under this Push-Pull hypothesis results from differences in economic, social, and geographic conditions in respective areas.

Social and geographic conditions generally change more slowly than economic conditions. Hence, it is the economic factors, particularly the relative economic conditions between resource based regions and manufacturing centres, that must be considered when predicting changes to net interprovincial migration. These factors can cause interprovincial migration to swing relatively quickly from net inflows to net outflows and vice versa.

Statistical analysis indicates that over the past thirty years, fluctuations in British Columbia net interprovincial migration have been correlated with differences in the growth of the British Columbia economy relative to the rest of Canada (primarily Ontario), as measured by real Gross Domestic Product, and to a somewhat greater degree with the relative difference between the British Columbia and Alberta unemployment rates. The following chart shows that these variables, when combined in a regression equation, can predict with reasonable accuracy the actual net interprovincial migration for B.C.

Model of net interprovincial migration

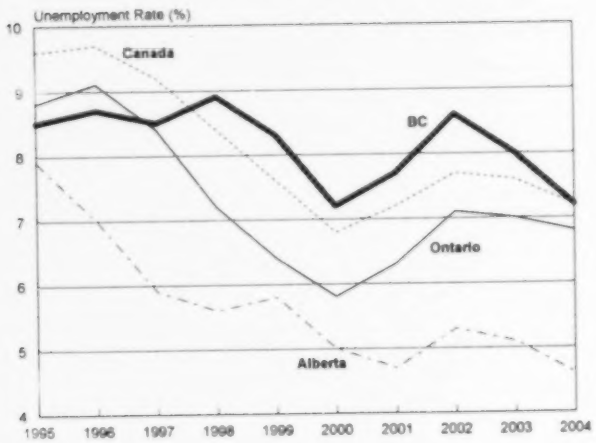


Many other economic factors likely play a role in influencing population movement (e.g. housing prices); however, in many instances empirical data on these factors are not available for a sufficient historical period to conduct statistical analysis. In addition, in order to forecast migration, consideration must be given to the practicality of forecasting the theorised determinants of migration. Both these constraints put limits on the number and type of variables considered as indicators of interprovincial migration. Consequently, the factors noted above do not uniquely describe inter-provincial migration flows, but rather are the ones that fit the

criterion of statistically significant correlation with past migration flows, and have the potential to be forecast themselves.

As noted earler, the levels of interprovincial migration from Alberta, Ontario and the rest of Canada are to some degree a reflection of the relative unemployment rates. Over the last twenty years, with the exception of 1993, B.C. has always had a higher unemployment rate than Alberta (2.6 percentage points on average), and for much of that period, B.C. has been the net recipient of population from Alberta. The exceptions to this unemployment rate differential were the mid-seventies and early eighties, when the differential reached 4 to 5 percentage points. Over the last six years, the difference has been between 2.2 and 3.3 percentage points.

In 2004, the gap between unemployment rates in B.C. and Alberta narrowed.



From 1993 through 1997, B.C. had a net migration of 17,700 persons from Alberta. Between 1998 and 2003 the flow reversed and Alberta received net of 56,647 persons from B.C. This contributed substantially to the large total net inter-provincial outflows from BC of over 57,000 people between 1998 and 2003. However, for the first time in six years, BC had positive net interprovincial migration in 2003 with 2,094 more people coming to the province than leaving and in 2004, as noted previously, a positive 7,800.

In 2004, the difference between Alberta and BC's unemployment rate decreased marginally from 2.9 percentage points in 2003 to 2.6 percentage points. The positive figures for net migration to BC are a result of fewer people leaving the province rather than more people arriving. Given the decrease in the net outflow in the last two years, it is anticipated that the outflow to Alberta will continue to slow during 2005.

The overall economic growth in B.C. (as measured by real GDP) recovered in 2003 and continued to be strong in 2004. Last year, the Canadian economy is estimated to have grown by 2.7 per cent, while economic indicators suggest that real GDP growth in this province was 3.3 per cent.[1] Economic growth in Canada is expected to remain at 2.7% in 2005, while B.C.'s economy is expected to grow by 3.1%. As a result, the inflow of people to B.C. from other parts of the country is expected to continue to increase in 2005.

Given the above considerations, the net outflow of British Columbians to Alberta is expected to be lower and offset by net inflows from the rest of the country, resulting in a projected net inter-provincial inflow of 9,000 persons in 2005, higher than the 7,080 in 2004.

Risks to the Forecast

The main risk to the 2005 migration forecast is the interprovincial component. If the economic conditions in B.C., relative to the rest of Canada improve more slowly than anticipated, the increase in net inflow of population could be reduced or reversed.

Another uncertainty is the forecast of B.C.'s share of Canadian immigration. If the share

[1] The figures for BC GDP are from the BC Ministry of Finance 2005/06 Budget.

is lower than expected or the level of immigration to Canada falls below the immigration plan, then the forecast of international migration to B.C. could be too optimistic. As well, rates of emigration may not decline as expected if relative economic conditions continue to improve in other regions of the world, particularly in Asia.

Prepared by: Population Section, BC STATS. Date: 24 March 2005

Source: Statistics Canada.

Note: Net N.P.R. - Net change in the number of Non-Permanent Residents.
Due to revisions on the part of Statistics Canada, the sum of the components may not equal the population change.
All figures subject to revision.
